Pipe fittings

Elbows, tees, reducers, unions, valves, plugs and caps to connect, control and seal steel pipes.

CARBON STEEL | STAINLESS | ALLOY STEEL

01 — INTRODUCTION

Steel pipe fittings

Steel pipe fittings are components used to connect, join, change direction, control the flow and seal pipes in plumbing, heating, ventilation and air conditioning systems, among others.

01 · Elbows
Change the direction of flow in the pipe.

02 · Tees
Connect three pipe sections in a T shape.

03 · Reducers
Connect pipes of different diameters.

04 · Unions
Allow pipe sections to be connected and disconnected easily.

05 · Valves
Control the flow of liquids or gases through the pipe.

06 · Plugs and caps
Close the ends of pipes.

PRODUCT LINE Galvanized threaded fittings.

02 — ELBOWS

Elbows

Used to change the direction of flow in the pipe.

Types of elbows

- **By material:** carbon steel, stainless steel and alloy steel.
- **By flow direction:** 45°, 90° and 180°.
- **By length and radius:** short radius (SR) and long radius (LR).

Elbows, reducers and tees in different finishes.

03 — TEES

Tees

Connect three pipe sections in a T shape.

Types of tees

- **By material:** carbon steel, stainless steel and alloy steel.
- **By connection:** threaded, socket-weld and flanged.

04 — REDUCERS

Reducers

Used to connect pipes of different diameters. They can be concentric or eccentric: concentric reducers are the most common; eccentric ones are used where space or alignment is a problem.

Types of reducers

Concentric

Conical parts with parallel ends and concentric axes, to join pipes of different diameters.

Common in horizontal or vertical runs without a set structure. Because they focus the flow toward the center, the working pressure is more stable and balanced.

Eccentric

Conical parts with parallel ends and offset axes, to join pipes of different diameters.

Used in installations aligned with a wall or floor, since they let the pipe line up with the structure.

05 — UNIONS

Unions

Allow pipe sections to be connected and disconnected easily.

Types of unions

- Threaded unions.
- Welded unions.
- Flanged unions.
- Compression unions.

The choice depends on the pipe material, the application and the strength and flexibility required.

06 — VALVES

Valves

Control the flow of liquids or gases through the pipe.

Types of valves

Ball | Gate | Butterfly | Diaphragm | Plug | Multiport

Valves are essential in industry to control the flow and pressure of fluids in water treatment and supply systems, and in wastewater treatment.

07 — PLUGS AND CAPS

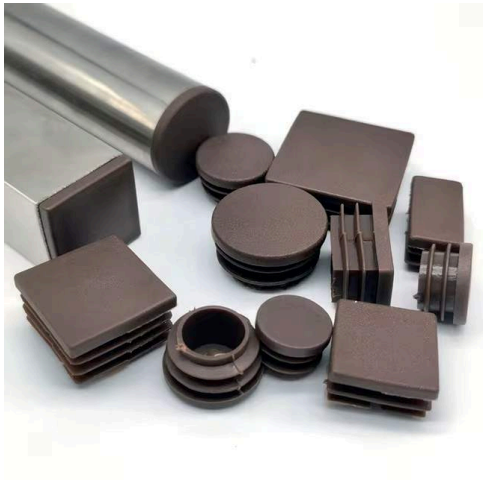

Plugs and caps

Used to close the ends of pipes.

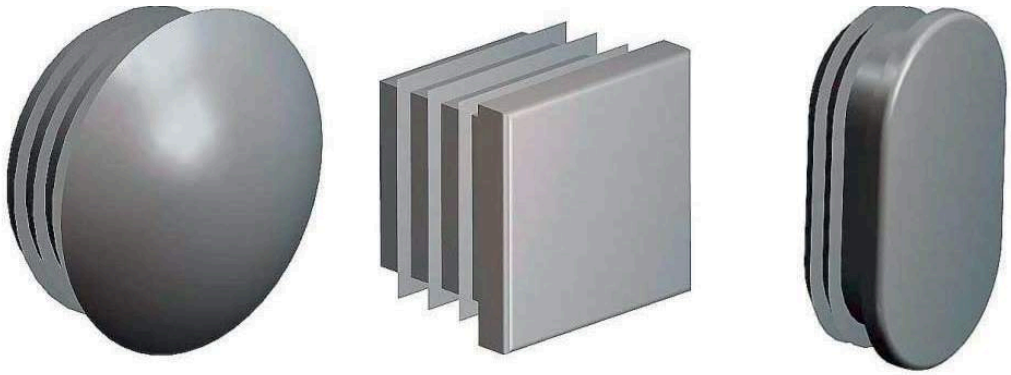

Types of plugs and caps

- Mechanical.
- Push-fit.
- Welded.
- Drain plugs, among others.

The choice depends on system pressure, cost, permanence and convenience.
